

## CALL FOR SCIENTISTS

### IODP Expedition 377: Arctic Ocean Paleoceanography (ArcOP)

An IODP Mission Specific Platform Expedition organised by the  
ECORD Science Operator (ESO)

**DEADLINE: Friday 19 June 2020**

Applications are invited from scientists in countries participating in IODP to join the Science Party for IODP Expedition 377: Arctic Ocean Paleoceanography (ArcOP). Any scientist from an IODP member country with expertise relevant to the objectives of the proposal may apply.

**Please note that this call supersedes the previous Call for Scientists in June 2017.** We are not carrying over previous applications, and we would welcome fresh applications from both new and previous applicants. Please also note that ESO are in the process of tendering for vessels and ice management services, and contract negotiations will take place this summer. Applicants should please keep in mind that, at this time, ESO cannot guarantee that the expedition will be implemented as described under ‘timing’ below. However, the expedition schedule will be confirmed before formal invites are issued later in the summer.

The proposal upon which this expedition is based was submitted as IODP Proposal #708 ‘Arctic Ocean Paleoceanography’. The full proposal and addendum describing the primary drill sites, as well as up-to-date expedition information, can be found on the Expedition 377 webpage <http://www.ecord.org/expedition377/>.

The Co-chief Scientists for this Expedition are [Prof. Rüdiger Stein](#) (Alfred Wegener Institute Helmholtz Centre for Polar and Marine Research Bremerhaven, and University of Bremen, Germany) and [Prof. Kristen St. John](#) (James Madison University, Harrisonburg, USA).

## Background and Objectives

The overall goal of the drilling campaign is the recovery of a complete stratigraphic sedimentary record on the southern Lomonosov Ridge to meet the highest priority paleoceanographic objective: the continuous long-term Cenozoic climate history of the central Arctic Ocean. Furthermore, sedimentation rates two to four times higher than those at the site of IODP Expedition 302: ACEX permit higher-resolution studies of Arctic climate change in the Pleistocene and Neogene. This goal can be achieved by careful site selection, appropriate drilling technology, and applying multi-proxy approaches to paleoceanographic, paleoclimatic, and age-model reconstructions.

This sedimentary sequence from the central Arctic Ocean will be studied to answer the following key questions:

- Did the Arctic Ocean climate follow the global climate evolution during its course from early Cenozoic Greenhouse to late Cenozoic Icehouse conditions?
- Are the Early Eocene Climate Optimum and the Oligocene and Mid-Miocene warmings also reflected in Arctic Ocean records?
- Did extensive glaciations (*e.g.*, the OI-1 and Mi-1 glaciations) develop synchronously in both the Northern and Southern Hemispheres?
- What is the sedimentary record of timing of repeated major (Plio-) Pleistocene Arctic glaciations as compared to that postulated from sediment echosounding and multi-channel seismic reflection profiling?
- What was the variability of sea-ice in terms of frequency, extent and magnitude?
- When and how did the change from a warm, fresh-water-influenced, biosilica-rich and poorly ventilated Eocene ocean to a cold, fossil-poor, and oxygenated Neogene ocean occur?
- How critical is the exchange of water masses between the Arctic Ocean and the Atlantic and Pacific for the long-term climate evolution as well as rapid climate change?
- What is the history of Siberian river discharge and how critical is it for sea-ice formation, water mass circulation and climate change?
- How did the Arctic Ocean evolve during the Pliocene warm period and subsequent cooling? How do the ACEX2 records correlate with the terrestrial record from the Siberian Lake El'gygytgyn?
- What is the cause of the major hiatus recovered in the ACEX record? Does this hiatus in fact exist?

## Timing

Until the platform and drilling services are confirmed (estimated summer 2020) all timings are provisional. It is envisaged that the offshore phase of the expedition will last a maximum of 50 days between mid-August and mid-October 2021, with only a subset of the Science Party participating. Offshore activities will focus on core recovery, curation, sampling for ephemeral properties, biostratigraphy, physical properties, preliminary lithostratigraphy (whole core observed at core ends and through plastic liners), and downhole logging. The cores will not be split at sea.

Subsequently, an Onshore Science Party (OSP) will be held at the MARUM - Center for Marine Environmental Sciences, University of Bremen, Germany, in either late 2021 or early 2022 (exact dates to be confirmed), where the cores will be split. The OSP will be a maximum of 4 weeks long, the exact length dependent on core recovery. All members of the Science Party must attend the Onshore Science Party. Please see <https://www.ecord.org/expeditions/msp/> (and linked pages within) for an overview of Mission Specific Platforms in IODP.

Successful applicants will be invited either as an offshore-onshore participant, or as an onshore-only participant. Please note that there are no opportunities for offshore-only participation.

## Expertise sought

Opportunities exist for researchers (including graduate students) in all specialties. While other expertise may be considered, specialists in the following fields are required: sedimentology, micropaleontology, palynology, organic geochemistry, inorganic geochemistry, structural geology, paleomagnetism, microbiology, physical properties, geophysics, stratigraphic correlation and downhole logging. For the offshore phase of the expedition, we are particularly looking for the following fields: sedimentology, micropaleontology, palynology, organic geochemistry, inorganic geochemistry, microbiology, physical properties, and petrophysics/downhole logging.

## Information webinar

To learn more about the scientific objectives of this expedition, life at sea, and how to apply to sail, please join us for a web-based seminar on **Tuesday 26 May 2020** at 1pm BST.

To register, please visit:

[https://www.surveymonkey.co.uk/r/IODP377\\_2021](https://www.surveymonkey.co.uk/r/IODP377_2021)

## Where to apply - IODP Program Member Offices

Applications for participation must be submitted to the appropriate IODP Program Member Office – please see <http://www.iodp.org/about-iodp/program-member-offices>. Please specify if you are interested in the offshore-onshore or onshore-only aspects of the Expedition. Please note that there is no option to participate offshore-only.

Applications should reach the appropriate Program Member Office no later than **Friday 19 June 2020**; candidates shortlisted by the Program Member Offices will be considered by ESO in summer/autumn 2020.

For further details from ESO, please contact:
